

Create a Quiz

For today's assignment, you will use what you've learned about collecting form values to create a quiz application. Here are the requirements:

1. Create 5 or more quiz questions with a total of 3 different types of inputs.
 - Text, radio, and checkbox inputs are great. Feel free to get creative with other input types, too.
2. Display the questions on your page.
3. Require that each question be filled out.
4. When a user submits the quiz, score it and display their score.
5. Once you've finished creating your quiz, modify your code to only show one quiz question at a time.
6. Consider everything you've learned up through now. Make your quiz look good. This could be a potential project for your portfolio.
7. When you are done, **create a Github page** for this project and submit a link to the actual quiz website you've created on Brightspace.

If you have questions about your code, please email me the Github page link. Thank you.
